STARTING MECHANISM FOR FILTER HIGH-FREQUENCY PROTECTION

At the request of the Technical Department of the Ministry of Electrical Stations of the USSR, the editors of this periodical consider it necessary to publish the following information.

The Inventions and Discoveries Administration of the State Committee for the Introduction of Progressive Technology into the Economy has clarified the text of Certificate of Authorship No 40817 granted G. I. Atabekov and Ya. M. Smorodinskiy. The clarification limits the characteristic features of the device described in this certificate to its use by the authors in a three-relay system, the relays' action depending upon the rate of change of electrical values. Thus, Atabekov and Smorodinskiy's reference to this certificate in an article (Elektrichestvo, No 1, 1946) relating to the use of a relay acting upon negative asymmetrical components of currents or voltage is not warranted.

A relay acting upon negative components of current or voltage, which was utilized in the starting mechanism for filter high-frequency protection applied to blocking circuits to prevent hunting, was first proposed by Engineer A. B. Barzani, who obtained Certificate of Authorship No 61423 in 1938.
